CAREER OBJECTIVE

B.E. CSE (Data Science) graduate, 2026, skilled in SQL, Excel, and Python for data preparation, analysis, and dashboarding (Power BI, Tableau, Streamlit). Experienced in gathering requirements and translating raw, messy data into clear, actionable business insights.

RELEVANT SKILLS

Data Analysis & SQL: SQL (MySQL, PostgreSQL), Data Preparation & Cleaning, Exploratory Data Analysis (EDA), Statistical Analysis, Requirement Gathering & Documentation

Visualization & Reporting: Power BI, Tableau, Streamlit, Excel (multi-sheet data modeling, macros), Plotly, Matplotlib, Seaborn

Programming: Python (Pandas, NumPy), SQL (Joins, Subqueries, Aggregate & Window Functions, Stored Procedures), JavaScript, HTML/CSS

Tools & Collaboration: Microsoft Office Suite, Git/GitHub, Technical Documentation

Domain Exposure: Healthcare, Ecommerce/Retail, Quick-Commerce Logistics

EXPERIENCE

Data Science Intern — KodNest Technologies, Bengaluru *Feb 2026 – May 2026*

- Conducted EDA and statistical analysis across 50,000+ transaction records, identifying 3 data-quality issues affecting reporting accuracy, and documented findings for the team.
- Cleaned and validated large-scale transactional data ahead of modeling, applying feature engineering techniques to improve data reliability for downstream analysis.
- Built a demand-forecasting model on 940,000+ records ($R^2 = 0.9658$) and translated the output into a Streamlit dashboard so non-technical product managers and analysts could explore insights without writing SQL.
- Gathered requirements from cross-functional stakeholders, then presented analysis findings as clear, actionable business recommendations in the final internship report.

PROJECTS

D2C Pulse Tracker — Data Collection & Pricing Analytics | *Python, SQL, Django, PostgreSQL* | github.com/sakshihn/d2c_pulse_tracker

- Scraped and collected pricing and catalog data across 4 D2C beauty brands, building an automated data-collection pipeline as the foundation for downstream analysis.
- Cleaned and structured the scraped data into SQL tables, using window functions to track and analyze historical pricing trends over time.
- Applied TF-IDF and KMeans clustering to group similar products for competitive analysis, then visualized pricing shifts on a dashboard for stakeholder review.

QuickMind Analytics — Demand Forecasting Dashboard | *Python, Random Forest, Streamlit, SQL* | github.com/sakshihn/quickmind-analytics

- Collected and processed 940,000+ quick-commerce delivery records, performing data cleaning and feature engineering ahead of modeling.
- Built a Random Forest forecasting model ($R^2 = 0.9658$) to analyze and predict demand patterns across 8 quick-commerce platforms.
- Deployed results as an interactive Streamlit dashboard, enabling business teams to explore trends and forecasts without needing to write queries.

Healthcare RAG System — Data Pipeline & Evaluation | *Python, FAISS, LangChain, FastAPI* | github.com/sakshihn/healthcare-rag

- Built a data ingestion pipeline structuring 1,336 unstructured medical research excerpts into a searchable, indexed dataset.
- Created a 50-question evaluation dataset to test and validate output accuracy, documenting and reporting a 91% accuracy benchmark.

EDUCATION

B.E. in CSE – Data Science, Mysore College of Engineering and Management (VTU), Mysore *2022 – 2026*
CGPA: 8.2

Pre-University Education, Vikasa Pre-University College, Shivamogga *2020 – 2022*
78.8%

SSLC, Vikasa High School, Shivamogga *2020*
91.2%

CERTIFICATIONS & ACHIEVEMENTS

- Student & Placement Coordinator (2022–2026) — coordinated between faculty, students, and recruiters to manage placement-drive logistics and deadlines, developing strong stakeholder communication and cross-team coordination skills.
- Python, SQL & Data Science – Coursera / Kaggle | SQL – HackerRank | Cloud Computing – NPTEL (IIT Kharagpur)
- Open-Source Contributor — GSSoC'25 & OSCI'25 — merged PRs in Python/ML repositories, collaborating with distributed, cross-functional contributor teams.
- Published a technical article on a data pipeline build; presented project work at multiple hackathons under tight, 24-hour timelines.
